Project Name: JobShop
Group Names: Olivia Mates, Risha Vankalapati, Mansi Madhani

Contributions:

Olivia Mates (30%)

- Created front-end for starting screen, log-in screen, forgot password screen, and create account screens.
- Implemented the beginning steps for file upload and scan copy for the Add Resume screen.
- Began the process for resetting the user's password

Risha Vankalapati (35%)

- Created the Swiping on Matches screen with functioning "x-ing"/swiping right and saving of jobs with fleshed out sample data of jobs, as well as an expanded view screen of each job card when a user taps on it in both the Matches and Saved Job VCs
- Created Saved Jobs screen that connects to when a user "hearts" a job, all liked/swiped right on jobs appear here, can also change the status of application ad Apply link for now routes to career website associated with dummy data
- Created navigation bar between screens

Mansi Madhani (35%)

- Created the front-end for the settings screen as well all front-end for the updating profile preferences screens within settings
- Set up Firebase authentication and basic Firestore to capture the name, password, birthday, and email address for individual accounts
- Added functionality for creating an account, log-in screen authentication, displaying the name and email of the logged in user on the settings screen, and updating basic profile info (name, birthday, and password)

Deviations:

- Planned on creating functioning filtering of jobs based on job preferences but we decided that we wanted a working front-end before complex back-end features. We realized as a team that we did not plan out when we were going to complete the front-end (Alpha or Beta) and decided that it makes most sense to the team if we can visually see the flow of a "bare bones" version of the app before getting into the nitty gritty of the job recommendations.
